DARPA // BETR

BIOELECTRONICS FOR TISSUE REGENERATION

An adaptive system designed to intervene in wound healing

RECORD IDENTITY

Defense Advanced Research Projects Agency (DARPA)
DARPA public program record: 2019

WHAT THE PUBLIC RECORD SAYS

BETR was created to accelerate warfighter recovery by directly intervening in the healing of complex wounds. The proposed architecture combined sensors, biochemical or biophysical actuators, and adaptive algorithms.

DOCUMENTED SYSTEM LOGIC

- **01** Continuously sense the condition of injured tissue
- **02** Use algorithms to interpret the healing response
- **03** Apply timed biochemical or biophysical stimulation

WHY THIS RECORD MATTERS

The architecture is a documented military loop: scan, interpret, stimulate and adapt while damaged tissue moves through stages of repair.
