DARPA // ELECTRX

ELECTRICAL PRESCRIPTIONS

Precision control of peripheral nerve activity

RECORD IDENTITY

Defense Advanced Research Projects Agency (DARPA)
Program announced: 2014 | Team selections: October 5, 2015

WHAT THE PUBLIC RECORD SAYS

ElectRx was designed to develop closed-loop, minimally invasive or non-invasive systems that monitor and modulate peripheral nerve activity. DARPA described targets including pain, inflammation, post-traumatic stress, severe anxiety and trauma.

DOCUMENTED SYSTEM LOGIC

- **01** Sense physiological or neural activity
- **02** Interpret the body's response in a closed loop
- **03** Deliver precise neuromodulation instead of a conventional drug

WHY THIS RECORD MATTERS

The public record shows a U.S. defense program explicitly pursuing electrical control of biological pathways associated with healing and whole-body regulation.
