# What We Built — Explained Simply

AdventureNLearn × Nacho Business · 2026-09-24

## What You Have

An NVIDIA RTX 5080 with 16GB VRAM and CUDA. This runs AI models locally that the estate's AMD card cannot. No cloud. No subscription. Your GPU does the thinking.

## Software to Download (in this order)

1. Roblox Studio — roblox.com/create. The 3D world builder. Free.

2. Rojo — github.com/rojo-rbx/rojo/releases. Syncs code files to Studio. Also install the Rojo plugin inside Studio.

3. Ollama — ollama.com. Runs AI models on your GPU locally.

4. Hermes Agent — you already have this. Point it at http://localhost:11434 (Ollama).

5. VS Code — code.visualstudio.com. Install the Lua extension.

## Your Model

Run: ollama pull hf.co/OrcaRouter/OrcaSAQ-2-27B-gguf

12GB, fits your 16GB VRAM, 70.0 SWE-bench (writes working code), 262K context. Point Hermes at it. Your 5080 runs it at ~40-60 tokens/second.

Free API keys if you need bigger models: OpenRouter (openrouter.ai), Groq (console.groq.com), NVIDIA Build (build.nvidia.com), Cerebras (cloud.cerebras.ai).

## Your First Game

The estate already wrote the Luau code. It's at game_roblox/src/. Five files: GameConfig.lua (constants), ShadowLedger.lua (the hall's private record), TheAnswer.lua (the boss, 5 phases), HallOfSupper.lua (the spawn room), ServerMain.lua (boot).

The game: The Ledger of Empty Chairs. Six empty chairs at supper. Count them and candles light. Ignore them and the mural weeps. The hall files which you chose.

The boss — The Answer — deflects every attack at 15 degrees (the Wing Chun tell). Phase 4 bends light. Phase 5: the system's own orbital laser arrives. The player wins by standing the boss under it.

## How You Get Paid

Roblox pays 70%. $0.0035 per Robux. Minimum payout: 30,000 Robux (~$105). Free-to-play + Game Pass (99 Robux) + Dev Product (49 Robux) + Premium Payouts. 430 pass sales = first payout. Post your launch clip on X. Your development loop is instant, free, unlimited on the 5080.

## Copy These Patterns

| Pattern | What It Does |
|---|---|
| Key Law | One key, one name, one loader. Audit fails on orphaned keys. |
| Append-Only | Every action writes a row. Nothing deleted. History preserved. |
| Standing Tasks | Scheduled jobs that run every morning without you. |
| Receipt-First | Every claim has a URL, a script, or a measured number. |
| Decode-First | Run the analysis before writing the response. |
