Adam's Setup Guide — AI Game Development

Nacho Business × Adam · 2026-09-24

What You Have

An NVIDIA RTX 5080 (16GB VRAM, CUDA). This runs AI models locally that most people need cloud APIs for. Hermes Agent is already installed. Here is everything else you need, in order, with the exact commands.

Software Setup (PowerShell)

Open PowerShell as Administrator. Run these in order.

```
# Download and install Roblox Studio # Go to https://www.roblox.com/create and click "Start Creating" # Follow the installer prompts. Free account required. # Verify: open Roblox Studio after install # You should see the Baseplate template

# Download and install from https://ollama.com/download/windows # Or use winget: winget install Ollama.Ollama # Verify: ollama --version

ollama pull hf.co/OrcaRouter/OrcaSAQ-2-27B-gguf # Verify it generates: ollama run hf.co/OrcaRouter/OrcaSAQ-2-27B-gguf "Write a Lua function that prints hello" # Type /bye to exit

# Create a tools directory mkdir C:\tools -Force cd C:\tools # Download Rojo 7.7.0 curl -L -o rojo.zip "https://github.com/rojo-rbx/rojo/releases/download/v7.7.0/rojo-7.7.0-windows-x86_64.zip" Expand-Archive rojo.zip -DestinationPath rojo # Add to PATH (permanent) $env:PATH += ";C:\tools\rojo" [System.Environment]::SetEnvironmentVariable("PATH", $env:PATH + ";C:\tools\rojo", "User") # Verify: rojo --version

winget install Microsoft.VisualStudioCode # Install Lua extension code --install-extension sumneko.lua # Install Rojo extension (for Studio integration) code --install-extension rojo-rbx.rojo

winget install Git.Git # Clone the game project git clone https://github.com/NachoBusiness/game_roblox.git cd game_roblox # If the repo is private, ask for access
```

Connect Hermes to Your Local Model

Hermes needs to know about your local Ollama instance. In your Hermes config or chat, set:

```
Model endpoint: http://localhost:11434 Model name: hf.co/OrcaRouter/OrcaSAQ-2-27B-gguf Max tokens: 4096 Temperature: 0.2
```

Now Hermes runs on YOUR GPU. No API key. No billing. Your 5080 does the thinking at ~40-60 tokens/second. You can also connect Hermes to free API keys for bigger models when you need them (see Free API Keys below).

Free API Keys (for bigger models)

Your 5080 handles most tasks locally. For harder problems, these services give free API keys:

Service	What You Get	Sign Up At
OpenRouter	Free access to many models	openrouter.ai
Groq	Fastest free inference	console.groq.com
NVIDIA Build	Free credits, 82 models	build.nvidia.com
Cerebras	Very fast free inference	cloud.cerebras.ai

Put keys in a .env file next to your project. Format: KEY_NAME=value

The Game Code (Already Written)

The estate already wrote the Luau code for your first game. Clone it and sync:

```
# Clone the game project git clone https://github.com/NachoBusiness/game_roblox.git cd
game_roblox # Start the Rojo sync server rojo serve default.project.json # Keep this terminal
open. It serves on port 34872.
```

Then in Roblox Studio: 1. Install the Rojo plugin (Plugins > Manage Plugins) 2. Click Rojo > Connect 3. Enter localhost:34872 4. The Lua code appears in Studio 5. Press Play

File	What It Does
GameConfig.lua	Shared constants: 6 chairs, boss phases, narrative
ShadowLedger.lua	The hall's private record of what each player chose
TheAnswer.lua	The boss: 5 phases, 15-degree tell, light deflection
HallOfSupper.lua	The spawn room: 6 empty chairs, counting, the mural
ServerMain.lua	Boot sequence connecting everything

What The Game Is

The Ledger of Empty Chairs. Six empty chairs at supper. Count them and candles light. Ignore them and the mural weeps. Sit in one and the count breaks. The hall files which you chose.

The boss is called The Answer. Five phases. In Phase 3 it deflects every attack at a 15-degree angle — that angle comes from real research data in the estate's corpus. In Phase 4, light bends around it. In Phase 5, the system's own orbital laser arrives. The player wins by standing the boss under it.

The rule: never state the truth. Hint. Let the player connect it themselves.

Free Game Assets and Tools

9 AI specialists and 64 skills for game asset generation: 2D sprites, 3D models, rigging, textures, skyboxes, walkable worlds, music, SFX, cinematic trailers, store art. Wire into your coding agent via ComfyUI workflows.

```
git clone https://github.com/scenario-gamedev/gamedev-os.git

# 2D sprites and tilesets # itch.io/game-assets/free — thousands of free packs # opengameart.org —
CC0 and CC-BY assets # 3D models # sketchfab.com — free section # polyhaven.com — CC0 HDRIs,
textures, models # Sound and music # freesound.org — CC0 sound effects # freepd.com — public
domain music # sonicpix.org — free game music # Fonts # fonts.google.com — open source fonts

# Roblox default assets (free, built into Studio) # Toolbox in Studio: models, meshes, sounds,
images # Rojo for code sync (already installed above) # Wally for package management:
https://wally.run/ # TestEZ for unit testing: https://github.com/Roblox/TestEZ
```

How You Get Paid

Roblox pays developers 70% of what players spend. $0.0035 per Robux. Minimum payout: 30,000 Robux (~$105).

The path: free-to-play game, sell a Game Pass (99 Robux: double score), sell a Dev Product (49 Robux: extra life), enable Premium Payouts. 430 pass sales = first payout. Post your launch clip. Your 5080 means instant, free, unlimited development.

Quick Reference Card

Command	What It Does
rojo serve default.project.json	Start the code sync server

ollama pull <model>	Download a new AI model
ollama run <model>	Chat with a local model
ollama ps	See what's loaded in VRAM
git pull	Get the latest game code
code .	Open VS Code in current directory

```
1. cd game_roblox 2. rojo serve default.project.json 3. Open Roblox Studio + Rojo plugin + Connect 4. Edit Lua files in VS Code — changes sync instantly 5. Press Play in Studio to test 6. When ready: File > Publish to Roblox

# Ask Hermes (running on your 5080): # "Write a Lua script that [does X]" # "How do I make a part glow in Roblox?" # "Debug this Roblox error: [paste error]" # The estate's free lanes (all metered): # DeepSeek API — $0.14/M tokens, fastest workhorse # OpenRouter — free tier, auto-routing # NVIDIA Build — free credits, 82 models
```
