# MCP Document Tools: Dogfood Report

*Item mcp-docs | flash50 | 2026-09-28 | fallback build via reportlab*

## Scope

The ask ordered document MCP dogfooding; this session's MCP surface has 86 tools across 7 packs and none of them creates DOCX, PPTX or PDF. Verified against the seat tool list and the host config mcp.servers block (node_repl, cua_repl, web-search, web-reader, zread, zai-vision). The document MCP work was done as research plus read side dogfooding, and the deliverables were built on the local fallback path.

## What the ecosystem offers

Office-Word-MCP-Server: FastMCP over python-docx, about 50 tools, deep table support, convert_to_pdf, but no table of contents or headers and footers tool. Office-PowerPoint-MCP-Server: python-pptx, 34 tools over 11 modules, no PDF export. PDF servers (hanweg/mcp-pdf-tools, PDF Toolkit MCP, mcp-pdf): merge, split, extract and form fill first; creation is secondary.

## Clunky and missing

One tool per operation makes a formatted report cost dozens of round trips. python-docx cannot compute a TOC; Word populates the field on open. The z.ai search and read MCP backends rate limited this session with MCP -429 code 1302 on 7 of 9 searches. Missing here: any document creation server in the host config.

## Fallback receipt

mcp-docs-report.docx, mcp-docs-report.pptx and this PDF were built 2026-09-28 in flash50 by _mcpdoc_build.py using python-docx 1.2.0, python-pptx 1.0.2 (temp target install, shared venv untouched) and the venv's reportlab. All three files were reopened and verified after write.
